PROJECT: CONNECTION PIECE FOR VETRA
ROLE: PROJECT ENGINEER/PRODUCTION ASSISTANT
YEAR: 2025

Since October 2025, I have been assisting VETRA in their production of their custommade bikeframes. In my role as a mechanical design engineer, I worked on developing mechanical components for their physical products, guiding them from initial concept to a design ready for manufacturing. I created parametric CAD models to allow for quick design iterations and to accommodate different configurations. I also focused on optimizing designs to meet real-world manufacturing constraints, assembly processes, and tolerance requirements. Along the way, I worked closely with the VETRA team to prototype, test, and refine the design, always aiming to improve the products performance and functionality.

EMPLOYER: VAN OORD
ROLE: CAD MODELLING ENGINEER
YEAR: 2023-2025

As a CAD Modelling Engineer at Van Oord, a leading marine contractor specialising in EPCI offshore wind projects, I gained strong technical expertise while working closely with structural, mechanical, and multidisciplinary teams. I played a key role in the design and execution of complex offshore projects, using Autodesk Inventor, Autodesk Vault, and other CAD tools. My responsibilities included developing detailed parametric 3D models, assemblies, and engineering drawings, storyboards, performing clash detection, generating Bills of Materials, and creating visualisations across all project phases – from tender to installation.

PROJECT: VARIOUS PROJECTS/NACHO CARBONELL
ROLE: WORKSHOP ASSISTANT
YEAR: 2018-2022

Nacho Carbonell is a Spanish designer and artist whose practice operates at the intersection of design, craftsmanship, and sculpture. His work is driven by material experimentation, hands-on processes, and unconventional techniques, resulting in unique and limited-edition pieces that explore the relationship between objects, nature, and everyday use. As part of Nacho Carbonell's studio, I work as an electrician and product design engineer, solving complex technical and electrical challenges throughout the development and production of furniture, lighting, and sculptural objects. My role focuses on translating conceptual ideas into functional, safe, and technically robust solutions, working closely with the design and production teams to develop custom systems, prototypes, and bespoke technical integrations. Carbonell's work has been exhibited internationally, including at the Venice Biennale (2019) and Art Basel/Miami, as well as in major museums worldwide such as the Groninger Museum (Netherlands), 21_21 Design Sight (Japan), the Fonds National d'Art Contemporain (Paris), the San Francisco Museum of Modern Art, the Art Institute of Chicago, and the Mint Museum in Charlotte, North Carolina. His piece One-Seater Concrete Tree (2022) was recently acquired by the Cincinnati Museum of Art, and his works are also part of several private collections.

PROJECT: VARIOUS PROJECTS FOR LEBREL
ROLE: PRODUCTION ASSISTANT
YEAR: 2017-2018

After my graduation, I started working in Valencia at Fernando Abellana's workshop, better known as Lebrél Furniture. During my stay, we would take care of all design processes, from the first drafts until the manufacturing, caring for every detail and learning from the beginning until the end of the object. We made all kinds of furniture, from minimalist tables to geometrical metal stairs, the whole furniture system of a clothing store, designing and manufacturing lamps or even a custom kitchen system. The primary materials of all pieces were metal and wood, playing and mixing them: searching function and the easiest ways of assembling.

PROJECT: LAB-01, SHELF SYSTEM
ROLE: DESIGN & PRODUCTION
YEAR: 2018

Lab-01 was made upon request from Canoa Labs in Valencia. They needed a shelving system to store their chemical products, specifically powders and mix for ceramic glazes and patinas. This time, I created a simple, solid system with plenty of space. It is easy to clean, capable of storing heavy objects, and visually blends in with the overall workshop environment.

PROJECT: MESITA-01
ROLE: DESIGN & PRODUCTION
YEAR: 2018

Mesita-01 is a bedside/coffee table made from steel and a big piece of blue glass and white marble stone terrazzo. The table was made as a self-learning exercise. The structure was designed with the intention of having a unique, solid piece of forever-lasting furniture.

PROJECT: NOMADA.1
ROLE: GRADUATION PROJECT
YEAR: 2017

Nómada is a set of furniture that I did for my final degree project. It is an object made for work, rest, and storage. I aimed to create functional furniture that would be easy to assemble, disassemble, and transport. I also wanted it to be economical, practical, and charged with symbolism. The project is designed under the open design philosophy; each piece of furniture has its independent instructions, downloadable on the website cristiansanchezz.github.io/nomada-opendesign/, making them accessible to all. It is a socially conscious and responsible project, focusing on material dispossession as preached by Victor Papanek. I based my methodology on relevant information about other similar projects and tests with prototypes. Calculations of elements such as the screws and structure strength were performed partly through digital study with the SolidWorks 3D model. The sum of the research resulted in a life-size final prototype. Through the design process, I considered the Design for Disassembly (DFD), eco-design strategies like the Environmentally Responsible Product Assessment Matrix, the EcoDesign Check-list, Life- Cycle Assessment (LCA), and other systems to design an environmentally friendly and sustainable product.
